=====

Anyways, in your post you talk about a PDdownloads *module* as an example of the change you have made to the *core* of XOOPS.

Yes and NO.

This is one example for generation clones and this is correct in core xoops.

Quote:

Perhaps we can understand you better when you explain in detail what the changes are you have made to the core, and what their function is. That way we can review the changes (as we have done in the past with all changes submitted to the [sf.net Core Patch Tracker](#)), and deal with it accordingly.

Yes, perfect

I am go to.

Quote:

As for changes to the core, the [Development Roadmap for XOOPS 2.2](#) clearly explains that the core is being changed in order to *make more possible* for module developers. It's not a big list of features that is being added, but the modularisation of some core features, and making everything more flexible to use in your modules (page awareness, editor framework, admin themes, etc.). This leads to the conclusion of this post: in order for a new feature to be added to the XOOPS core, it would have to be nearly impossible or very inefficient to do it in a module. So, it is **make it a module, unless it is nearly impossible to do so and more efficient to put it into the core**. Of course we take every submission serious enough to look for possibilities.

Herko

For my use ?

I can too framework good, was compatible ?

No have acess new version for help you, sorry

Thanks for replay.

Go to XOOPS in Brasil.
