URL:

I cleaned up the file a bit and added a link for users to reload the file in case they entered the wrong email and want to try again.

This should REALLY, REALLY be included in the core! I inserted the link into the Login block as suggested. If it makes it into core, an additional link or code block should be added to the user.php file.

Kurt

Here is the file:

```
<?PHP

OK, I decided to install this file and it seems to be working fine. The one addition I'd like to add is if the user enters an email that is not in the system and they realize they mistyped it, I'd like them to be able to refresh the page and retry. However the script seems to have cached the last email entered.

I've tried

```
reset ($HTTP_POST_VARS);
reset ($HTTP_GET_VARS);
```

and it doesnt seem to clear the \$email variable.

Thoughts?

There was a patch/hack named ATIVACAO.PHP

See topic: <http://www.xoops.org/modules/newbb/viewtopic.php?de=flat&order=ASC&start=0>

Please read carefully.

Perhaps somebody can adjust this script to the latest 2.0.13.2 and 2.0.14+

As far as I know this patch has never been implemented in the core.

You have to consider that: if they fill in the emailaddress but their spamfilter has its setting strong, the same activate email will be deleted by the same spamfilter of the user! So the resend won't make any sence if they don't change their spamfiltersettings.

Grtz., Shine
