There is a hack/module that make XOOPS URL friendly.

So.... why that's not on the core??

everyone needs thisOk, this is a good option, but is not a NEED, i can live with normal urls. Like m0nty said, today search engines can read the url's as they are, so you can wait the implementation of simplified url in 2.3.

And url simplification isn't for everyone, because this feature dont work in every host server...

Quote:

Too many customization leads to fragmentation, spread in the community, forks, and in the bottom line will be better to develop your own system.I dont need to hack or make a customization. As you can see, your problems are not general problems. Think about: some of solutions for you can be new problems for other webmasters... Now, if what you want can be made in modules, you can use the features you need with module, and the others can still use the default features.

Everyone knows that linux is just a kernel in technical terms. Who cares about that?

Only the technical people. The linux developers and so on

Linux users and computer users does not care about this

They want a linux that works and its easy to operate

I know that ubuntu has a good kernel, and I want to know nothing more.

You still dont understand? I told this because you want to include a lot of things in core (kernel).

I told this for you understand: All visible things must be in module/theme. The core must work only like a bridge between php/mysql/apache and the visible area (module/theme/template). Just this.

The difference of Ubuntu (very easy to use) from Gentoo (very hard to use) is the packages (programs, modules, libs, etc). The kernel is basically the same.

I see the XOOPS in the same way: the kernel must be as clean as possible. What must diff a XOOPS website from another is the modules/themes

That's why you can see [this page](#). This is a page with various types of xoops, each one for each type of site. All these use the same kernel (core) of XOOPS 2.2, what makes a difference is the modules included.

That's the better thing to do for beginners: release different packs for different purposes. And of course, release the core alone too, like today.

So I think you are wrong to ask to include many things in core, when almost all of them can be included in modules or blocks...

Quote:

I'm talking about social network features, not a copy of a social network system

I agree, XOOPS must have more things related to involve the community and keep them visiting the site. But why don't you ask the features for module developers? Ask to phppp (who made the CBB) to include some functions in the forum.

Ask for someone to create new modules with new features.

Phppp already says about using the future CBB 4 in XOOPS 2.3 to work like comments too, so every comment in news, downloads etc. will go to topics in forum. So, XOOPS will be able to see comments and topics of forum in the same place.

This will use new functions of XOOPS 2.3, but still are third party modules working.

In this case, XOOPS 2.3 will include some functions in core, and modules like CBB will make use of them.

Again comparing with linux: New versions of kernel have a priority: security/bug fix and make the kernel compatible with new types of hardware.

I think the XOOPS core is basically the same: security/bug fix and make compatible with new versions and features of apache/php/mysql/smarty/xoops smarty...

Why drupal is 2.0 and XOOPS is 1.0?

See, this is not black and white.

Go to drupal site take a look at it and how it's organized and how can you interact with it

I'm testing it in localhost. But I don't like his organization, with modules integrated in core...

About interact, just one good point: option to anyone (based on permissions) create pages. But this is a module problem. There is no XOOPS module for this... So, we need someone to create a good module for this.

Something like the XT_conteudo but for all users, not just for admin, based on permissions

So, I [make a topic in XT](#) to ask for a new version of xt_conteudo with new features to solve this problem.

Quote:

Drupal is just an example that is closer to web 2.0 than Xoops

Ok, now I tested this drupal. My conclusion: It's more like an "all-in-one", with modules integrated with administration.

I think it's wrong. Each update in some modules must update the own drupal version, and dev team

core must waste time with modules integrated...

Now take a look in changelog of drupal: a lot of security fixes, so isnt very security...

Xoops is one of the most security CMS, and probalaly because dont have many modules with core, just banner, pm, comments, system (and i think in future none these will be integrated in core). Thats why XOOPS takes a lot of time to have new versions, exactly like the kernel linux...

Quote:

There is nothing really new on web 2.0

The new stuff is more about BEHAVIOR and FILOSOFY than NEW TECHNOLOGY

Again, the filsofy of drupal is to make an integration of core-modules, but i think this dificult the release of new modules and themes.

And about themes, i see the theme files from one theme of drupal and i cant see how to make a great theme for drupal. Comparing with xoops, in drupal i think is very hard to make great themes...

Quote:

blogging

RSS

tagging

group participation on making contend

you control your own data

social networking

Its all about modules... For rss, there is a lot of modules. For blog, there is wordpress and wordpress_mu, for tag, phppp release the XOOPS tag module for integrate tags between modules who suport this tag module.

Quote:

Can you make a web 2.0 site with XOOPS default?

No

If you know a litle of webdesing and copy and paste javascripts in theme or in file of js from xoops, you can make great sites, like you can see in that site with best sits of month.

Quote:

Can you make with XOOPS hacked and customized?

Yes

Including hacks you can make sites even more greats

Quote:

Its worth the job?

I dont know, because other systems have web 2.0 features integrated in their core

How many sites made with CMS are like you telling about and not like the "old"

xoops/phpnuke/newBB/IPB style?

And their are security and easy to made great sites, or is very hard to creat different themes with them?
