CBB 4.0 Is the Current Version Of CBB that is in Development In SVN. For Those who don't know or want to know how to use SVN can Check It Out **Here**.

CBB 4 And Frameworks Download Link (From SVN AUG.8.2007 A.D.).

I have packaged CBB 4 and Frameworks From SVN in a ZIP archive. (i would **not** suggest testing this on a live site. One of the main reasons is that Frameworks from SVN is different than the one that is on the xoopschina download section.

You Will Also Need To Download XooPS Editors From XooPS China for the module to work. (xoops-class-xoopseditor.zip (1.10))

http://dev.xoops.org/modules/xfmod/pr...owfiles.php?group_id=1155

So .. Test It. Hack It. Experiment With It.

Submit Bug Reports (At This Link.. Registration Required[/url]) or submit it at xoopsforge.com and someone will submit it to the tracker for you.

Would you please let me know which of the two XOOPS versions would be best to try this with. I would prefer to test it with the version that Giba provided the end-users at <http://www.xoops.net.br>

My question is: do I use it with the frameworks you provided in the zip package? Or IS there a download option from the China site that would be better?

Thank you in advance.
